

ABSTRACT

A camera signal processor comprises motion detection means for dividing an image picked up by imaging means into a plurality of motion detection areas, and detecting the motion of the image for each of the motion detection areas, extracting means for extracting, on the basis of the motion of the image for each of the motion detection areas which has been detected by the motion detection means, the motion detection area where an object making abnormal motion exists, and image enlarging means for enlarging the image picked up by the imaging means, centered on the motion detection area where an object making abnormal motion exists which has been extracted by the extracting means and displaying the enlarged image on a display device.
